## Income Distribution (High vs Low)

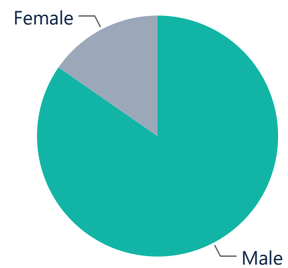

Income_Group ● Low Income ● High Income

## % Earning >50K by Education Level

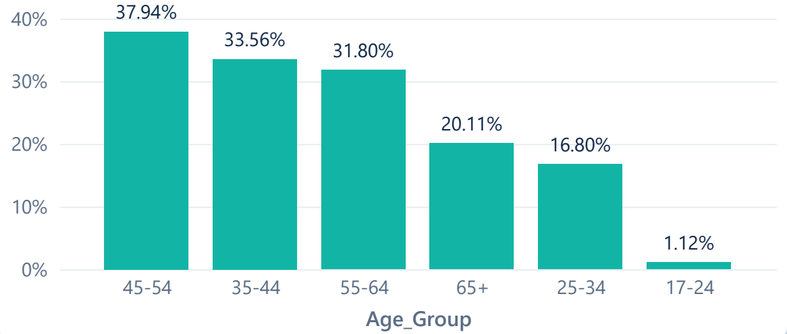

## Share of High Income Earners by Gender

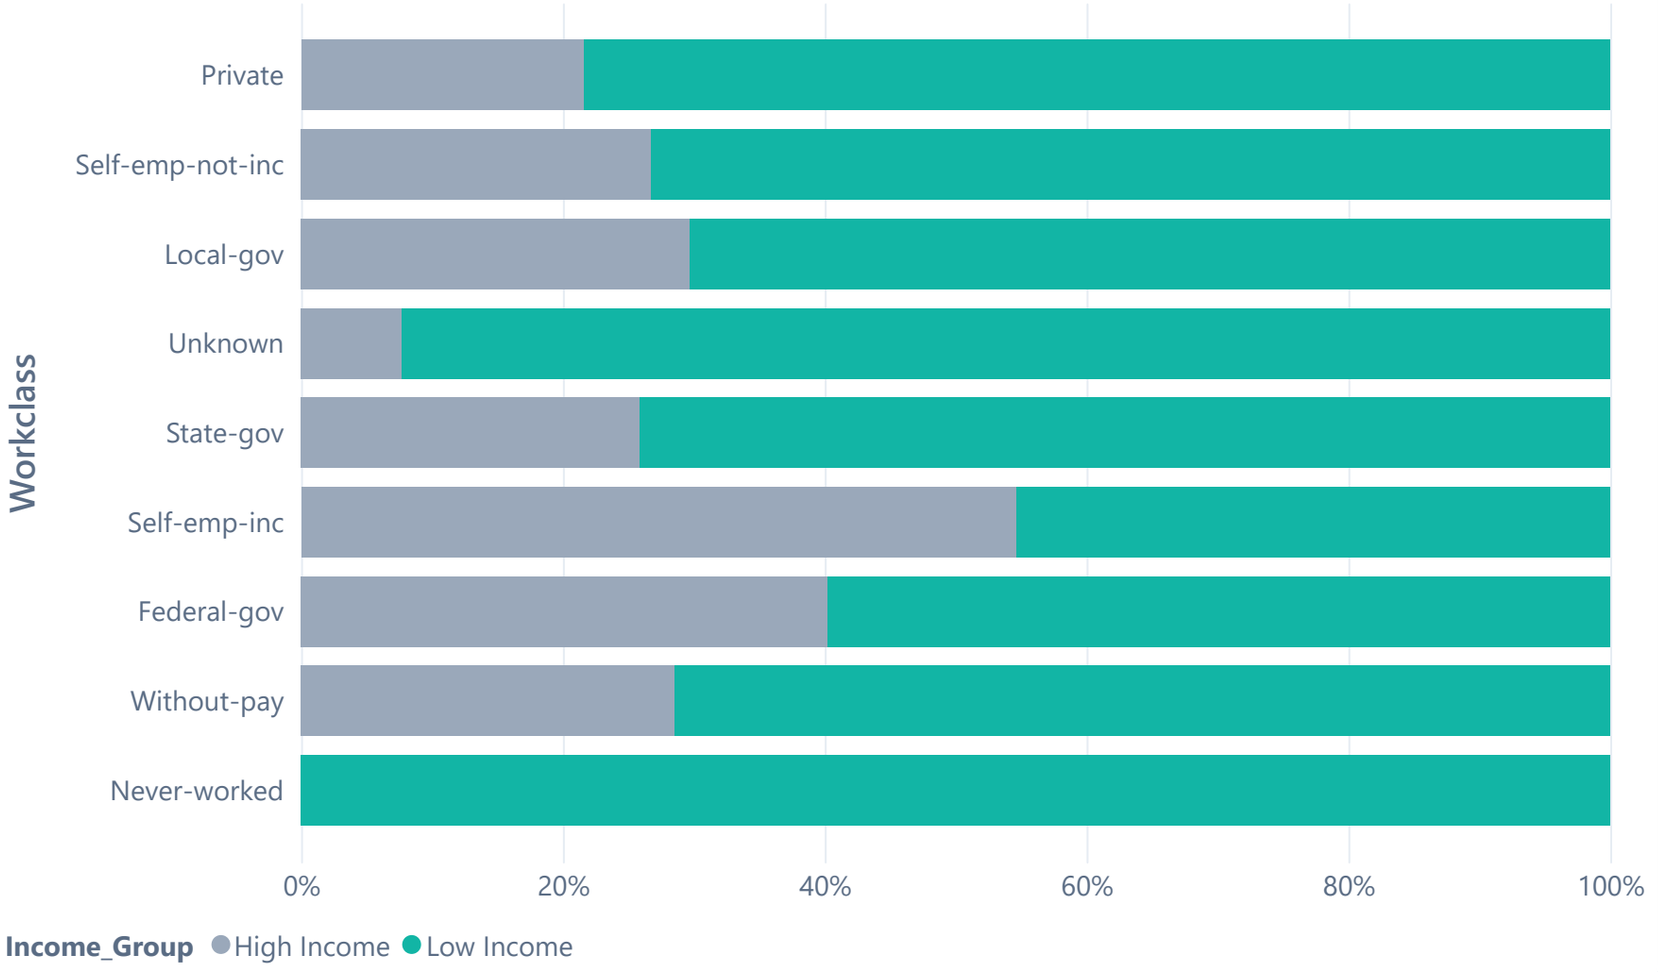

Sex ● Male ● Female

## % Earning >50K by Age Group

## Income Mix by Workclass

# INCOME ANALYSIS: EXECUTIVE NARRATIVE

Project overview, analytical approach and objectives

## EXECUTIVE NARRATIVE

A concise overview of the dataset, dashboard purpose, and analytical approach.
The Income Distribution Analysis project examines the UCI Adult Census Income dataset to understand how education, occupation, age, gender and working hours relate to earning above or below $50K. After cleaning, the dataset contains 16,276 records, with calculated fields added for income group, income flag and age group.

Data preparation in Excel included removing 5 duplicate records, labelling missing values as “Unknown” and standardizing text formats. The cleaned data was then loaded into Power BI for visualization.

The dashboard presents key indicators, including total records, the share of high earners, average age and average weekly hours. Interactive slicers allow users to explore the data by gender, race and income group.

The analysis compares income levels across education levels, age groups and gender, and shows how the income split differs between groups. These comparisons help identify the characteristics most associated with higher income.

The primary objective is to support a clear, data-driven understanding of income differences in the population. The findings describe patterns within the observed dataset and should not be interpreted as proof of causation.
